

Positioning Overview

You can set a position of elements with this button. When you select any object that requires position setting, then the button will be activated. And we provide you three different positioning methods; *Fixed*, *Absolute*, and *Relative*. About the 'positioning', refer to the following contents.

- **Absolute Position**

Position relative to the parent element.

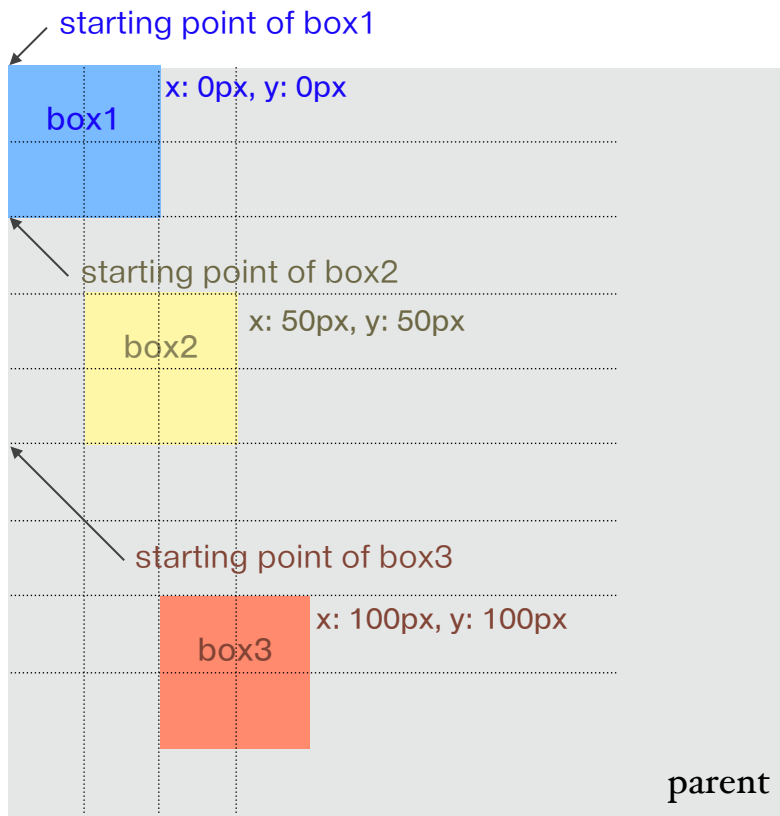

Example

- Relative Position

Position relative to its normal position.

Example

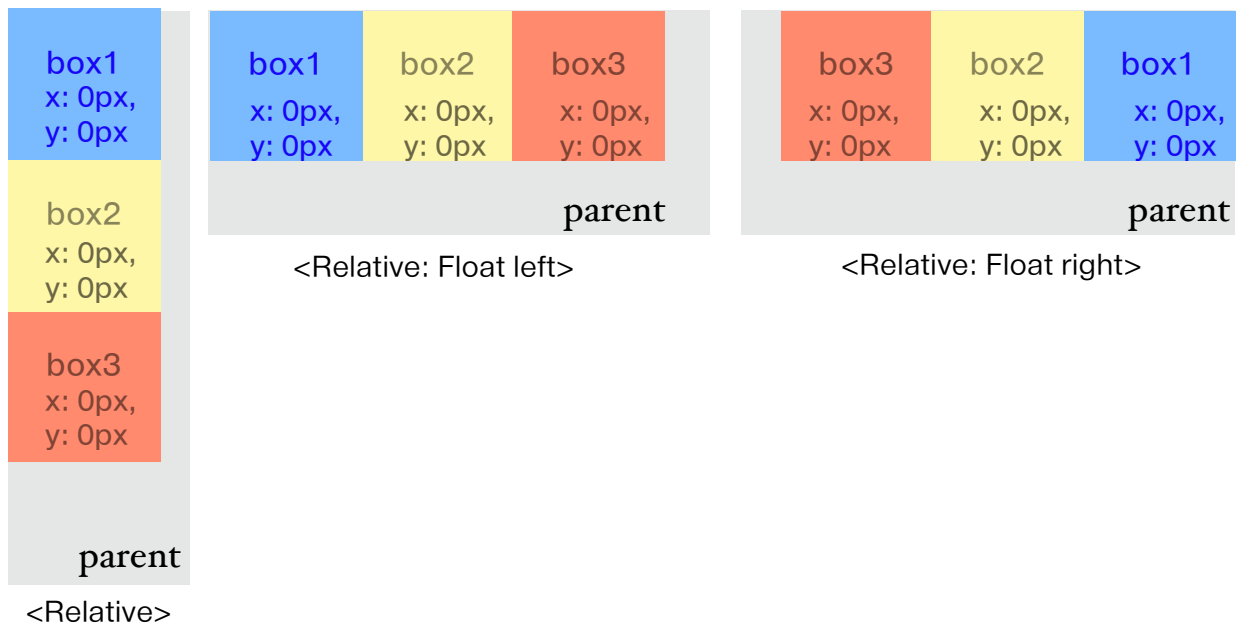

- Float

Float left aligns elements to the left side, Float right aligns to the right side.

Note: A float arrangement cannot be used with absolute position.

Example

- Fixed Position

Position relative to the browser window. It will not move even though the window is scrolled.
